

REMARKS

Rejections under 35 USC §103(a)

Claim 5 was rejected under 35 USC §103(a) as being obvious over WO 98/10111 (English equivalent U.S. Patent No. 6,136,101 to Sugawara et al.).

Claim 6 was rejected under 35 USC §103(a) as being obvious over reference as applied to claim 5 above, and further in view of acknowledged prior art admission.

Responding to Applicants' previous response, the Examiner alleged that applicants failed to point out the temperature difference between A₁ and eutectoid temperature.

Claim 5 has been amended to recite "heating said Fe-based alloy material setting an average rate H_R of heating from a normal temperature to a point A₁ in an Fe-C based equilibrium diagram to be in a range of $0.5^{\circ}\text{C}/\text{sec} \leq H_R \leq 6.0^{\circ}\text{C} / \text{sec}$, and setting a maximum temperature gradient T_G of the inside of the Fe-based alloy material per unit distance to be at $T_G \leq 7^{\circ}\text{C}/\text{mm}$." The relevant portion of the specification has also been similarly amended. The amendment is supported by Figs. 21 and 22. A person of ordinary skill in the art would clearly understand that the present invention is directed to heating from a normal temperature because these figures indicate that the Fe-based material samples were heated from a normal temperature.

Regarding the difference between the eutectoid point and eutectic point, the attached explanatory drawing shows the eutectoid point and eutectic point. **A₁ is eutectoid temperature.** Claim 5 recites "heating said Fe-based alloy material setting an average rate H_R of heating to a point A₁ in an Fe-C based equilibrium diagram to be in a range of $0.5^{\circ}\text{C}/\text{sec} \leq H_R \leq 6.0^{\circ}\text{C}$

/sec, and setting a maximum temperature gradient T_G of the inside of the Fe-based alloy material per unit distance to be at $T_G \leq 7^\circ\text{C}/\text{mm}$.” Thus, H_R applies to **below** A_1 .

In contrast, as pointed out in the previous response, Sugawara et al describes about the heating rate R_h as follows:

Then, each of the Fe-based casting materials was subject to an induction heating **with the heating rate R_h between the eutectoid temperature (770°C .) which was a temperature providing the minimum solid-solution amount h and the eutectic temperature (1160°C .) which was a temperature providing the maximum solid-solution amount g being varied.** When the temperature of each Fe-based casting material reached 1200°C . (a temperature lower than the solid phase line) beyond the eutectic temperature at the above-described heating rate, each Fe-based casting material was water-cooled, whereby the metal texture thereof was fixed.

(Col. 14, lines 39-50). Thus, EXAMPLE II and TABLE 4, referred to by the Examiner, shows the heating rate R_h between the eutectoid temperature A_1 and the eutectic temperature, shown as 1160°C , i.e., **above** A_1 . The attached explanatory drawing also shows the difference between the temperature ranges where the heating rate is controlled in the present invention and Sugawara et al.

Thus, Sugawara does not teach or suggest “heating said Fe-based alloy material setting an average rate H_R of heating from a normal temperature to a point A_1 in an Fe-C based equilibrium diagram to be in a range of $0.5^\circ\text{C}/\text{sec} \leq H_R \leq 6.0^\circ\text{C}/\text{sec}$, and setting a maximum temperature gradient T_G of the inside of the Fe-based alloy material per unit distance to be at $T_G \leq 7^\circ\text{C}/\text{mm}$.”

Response After Final
Application No. 10/615,193
Attorney Docket No. 000138A

For at least these reasons, claim 5 patentably distinguishes over Sugawara et al.

Claim 6 was rejected under 35 USC §103(a) as being obvious over reference as applied to claim 5 above, and further in view of acknowledged prior art admission.

Claim 6 depends from claim 5. Therefore, claim 6 also patentably distinguishes over Sugawara for at least the same reasons discussed above.

Acknowledged prior art admission has been cited for allegedly disclosing use of ultrasonic velocity to inspect cast metal. Such disclosure, however, does not remedy the deficiencies of Sugawara discussed above.

For at least these reasons, claim 6 patentably distinguishes over Sugawara and acknowledged prior art admission.

In view of the aforementioned amendments and accompanying remarks, Applicants submit that the claims, as herein amended, are in condition for allowance. Applicants request such action at an early date.

If the Examiner believes that this application is not now in condition for allowance, the Examiner is requested to contact Applicants' undersigned attorney to arrange for an interview to expedite the disposition of this case.
